### About CourseKata

CourseKata is an online statistics and data science textbook with interactive questions and real-world datasets. It tracks student activity to support research on learning.

### About the Data

We analyzed anonymized data on question type, chapter, engagement time, and student interest ratings in three textbooks to explore patterns in learning and participation.

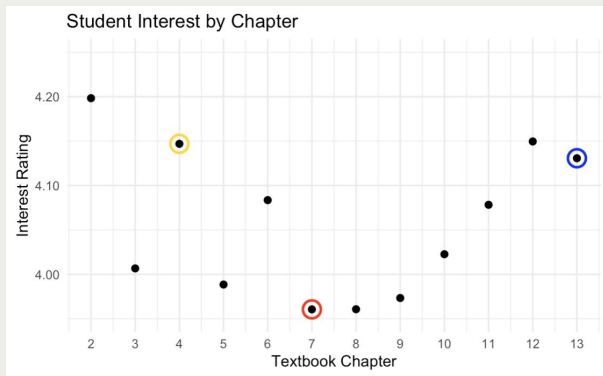

## Our Methodology and Focus

1. Optimize Question Type Selection to Boost Student Interest, Engagement, and Performance
2. Targeted Revision of Underperforming Chapters
3. Detect Academic Dishonesty Using Feature Engineering & RandomForest Modeling

Note: The six datasets contain 250 unique students across 3 online textbooks, appearing in ~246,000 activity logs (responses, page views, media, checkpoints)

# Identifying Question Types to Improve Student Interest, Engagement, and Performance

## *Selected Textbook: College / Statistics and Data Science (ABC)*

Top 3 Chapters with Highest Proportion of MCQ

| Chapter | Question_Type | Proportion of Questions |
|---------|---------------|-------------------------|
| 1       | mcq           | 0.942                   |
| 10      | mcq           | 0.914                   |
| 13      | mcq           | 0.883                   |

Top 3 Chapters with Highest Proportion of Plaintext

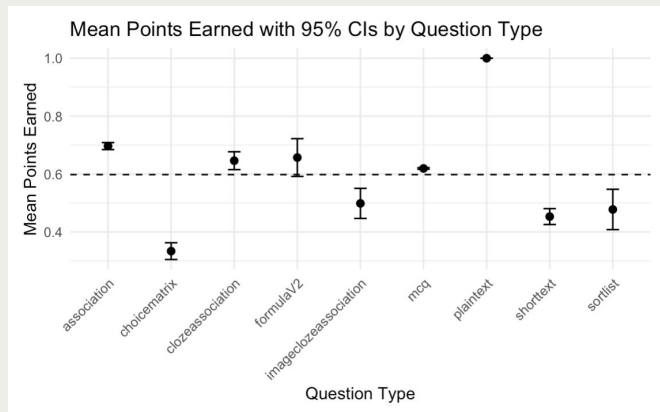

| Chapter | Question_Type | Proportion of Questions |
|---------|---------------|-------------------------|
| 5       | plaintext     | 0.266                   |
| 4       | plaintext     | 0.252                   |
| 3       | plaintext     | 0.230                   |

### Key Findings:

- Chapter 13 – High interest/engagement; high proportion of MCQs.
- Chapter 7 – Lowest interest/engagement; few MCQ and Plaintext.
- Chapter 4 – Moderate interest/engagement; relatively high proportion of Plaintext.

### Recommendation:

- Increase the proportion of **MCQ** and **Plaintext** questions in low-interest, low-engagement chapters like Chapter 7.

| Type_of_Question      | Better_Question_Type | p_value   |
|-----------------------|----------------------|-----------|
| choicematrix          | plaintext            | 1.35e-245 |
| imageclozeassociation | plaintext            | 4.70e-56  |
| shorttext             | plaintext            | 6.53e-220 |
| sortlist              | plaintext            | 6.27e-34  |
| choicematrix          | mcq                  | 4.92e-71  |
| imageclozeassociation | mcq                  | 6.90e-06  |
| shorttext             | mcq                  | 9.66e-31  |
| sortlist              | mcq                  | 8.54e-05  |

## Shifting Focus to Performance

### Key Findings:

- Students scored lower on choicematrix, shorttext, sortlist, and imageclozeassociation vs. MCQ and plaintext.
- MCQ and plaintext consistently ranked high for interest, engagement, and performance.
- Statistical testing (Welch Two Sample t-tests) confirmed these differences to be statistically significant ( $p < 0.001$ ).

### Recommendation:

- Reduce low-performing question types (choicematrix, imageclozeassociation, shorttext, sortlist) or add instructional support (guidance, explanations).

# Targeted Revision of Underperforming Chapters

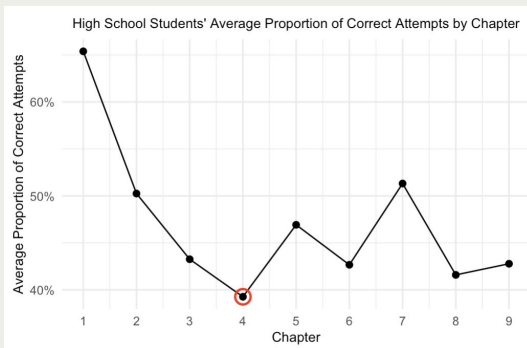

*Selected Textbook: High School / Advanced Statistics and Data Science I (ABC)*

## Focus on Chapter 4 of the High School Textbook:

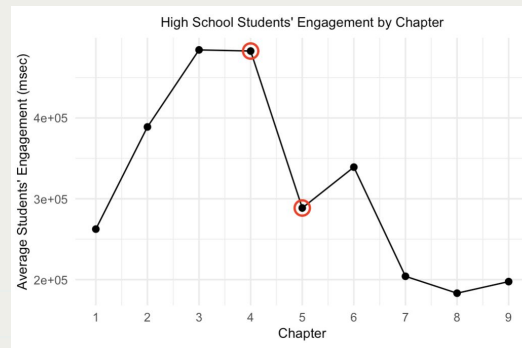

- Why? Lowest proportion of correct responses across all chapters/textbooks.
- Indicates higher difficulty for students, despite high engagement.

## Observations:

- Chapter 5 → Huge engagement drop off by ~40%.
- Indicates that the difficulty of Chapter 4 may limit progress and momentum into Chapter 5.
- Identifies Chapter 4 as a prime target for content revision and added support.

| Chapter | Average Proportion of Correct Attempts |
|---------|--|
| 1       | 0.654                                  |
| 2       | 0.503                                  |
| 3       | 0.433                                  |
| 4       | 0.393                                  |
| 5       | 0.469                                  |
| 6       | 0.427                                  |
| 7       | 0.513                                  |
| 8       | 0.416                                  |

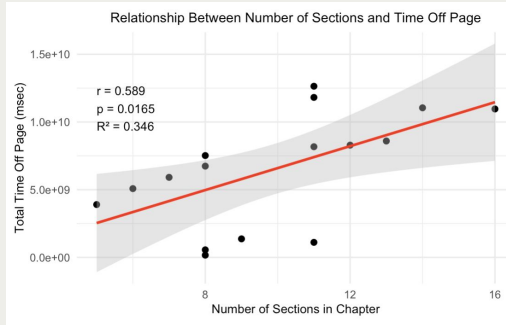

| Chapter | Average Students' Engagement (msec) |
|---------|-------------------------------------|
| 1       | 262,518                             |
| 2       | 388,904                             |
| 3       | 484,214                             |
| 4       | 482,795                             |
| 5       | 288,643                             |
| 6       | 339,191                             |
| 7       | 204,154                             |
| 8       | 183,229                             |

## High Time Off-Page in Ch. 4

| Chapter | Section Count | Total Time Off-Page (msec) |
|---------|---------------|----------------------------|
| 1       | 5             | 3,899,528,624              |
| 2       | 11            | 11,814,752,157             |
| 3       | 11            | 12,638,270,887             |
| 4       | 16            | 10,959,407,984             |
| 5       | 12            | 8,287,262,099              |
| 6       | 14            | 11,046,648,173             |
| 7       | 11            | 8,170,126,679              |
| 8       | 8             | 6,739,870,771              |

Fewer sections  
from Ch. 4 to 5  
and 24% decrease  
in Time Off-Page

### Recommendation:

- Reduce the number of sections per chapter (shorten chapters) to minimize time spent off-page and improve engagement.

## Higher Question Diversity in Ch. 4

| Chapter 4             |       | Chapter 5     |       |
|-----------------------|-------|---------------|-------|
| Question_Type         | Count | Question_Type | Count |
| mcq                   | 373   | mcq           | 110   |
| plaintext             | 209   | plaintext     | 99    |
| shorttext             | 23    | association   | 24    |
| choicematrix          | 22    | shorttext     | 18    |
| clozeassociation      | 18    | choicematrix  | 4     |
| association           | 9     |               |       |
| imageclozeassociation | 6     |               |       |

### Recommendation:

- Simplify and reduce the types of questions in each chapter (choicematrix and imageclozeassociation correlated with low student performance).

# Detect Academic Dishonesty Using Feature Engineering & RandomForest Modeling

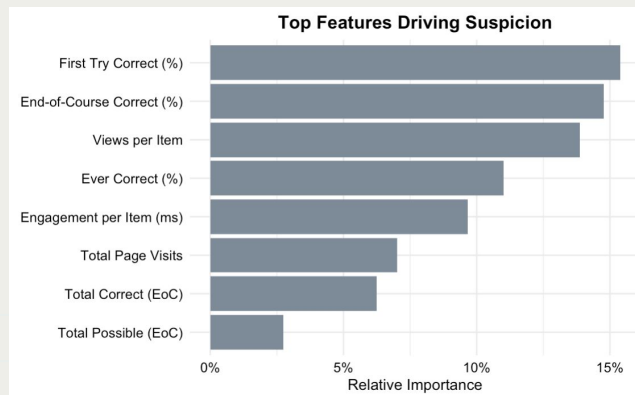

*Selected Textbooks: All (College ABC, College ABCD, High School ABC)*

## Approach:

- Engineered ~20 predictors/signals per student (accuracy, attempts, views/question, time engaged per question, idle time ratio, % night/weekend, burstiness, and more).
- Trained a Random Forest model
  - Created a proxy suspicion score based on extreme behavior like oddly high accuracy and low engagement (top 10% most suspicions were '1', others '0').
  - Model learned to distinguish these patterns.
    - For each student, it outputs a probability of how much they resemble the suspicious group.

## Important Note:

- Flagged students are for human review to save effort, not to be accused/punished.
- Model is not evidence of cheating → Just a triage list of students with suspicious patterns.

## Distribution of Model Outputs:

- Most students cluster near 0 with little suspicious activity.
- Small tail extends above 0.80, which is our selected (more conservative to reduce false positives) threshold for true suspicion.
  - Worth reviewing these students.

5.6% of students  
were flagged

## A Closer Look at Flagged Students:

- Students with high % correct and very low engagement time get flagged by the model.
- Aligns with intuition!
  - Not normal to put such little effort in (might be getting external help).
- Consistent with feature importance chart

## Flagged Students List:

- Shows the students with high suspicion probabilities (over 80%). 10 shown here.
- Includes important features for those reviewing the students.

| Student ID                       | Suspicion Prob. | % 1st-Try | % Ever | Views/Item | Engaged ms/Item | Mean Attempts |
|----------------------------------|-----------------|-----------|--------|------------|-----------------|---------------|
| a21ac54a-e190-486c-b805-c83b8... | 92.9%           | 86%       | 76%    | 0.310      | 89616           | 1.06          |
| ad3c8d11-b356-4b49-b6d1-1f932... | 92.4%           | 82%       | 74%    | 0.236      | 89040           | 1.12          |

| 8f3faf8d-8c56-4587-81c4-d6eb2... | 87.1%           | 87%       | 75%    | 0.302      | 94662           | 1.09          |

## CourseKata can...

- Use this as a review queue.
  - Advisors/instructors can dig into timestamps, attempts, and patterns.
  - Provides a starting point for outreach and academic support.
- Adjust the flagging threshold.
  - Tune up or down from the 80% benchmark depending on instructor needs.
- Learn general/aggregate insights.
  - Discover overall class patterns and decide if interventions are needed on an individual or class-wide basis.
